Psychics

Product Brief · AI Builder Space Proseminar

Haemin, Mrunali, Grace | October 1, 2026

Psychics is a digital service offering three distinct psychic readings — a Korean birthday-based reading, a Chinese zodiac-based reading, and a Harry Potter-style sorting hat experience — all accessible through one unified selection interface.

1. Basics

Project name: Psychics. **Team:** Haemin, Mrunali, and Grace. **Type:** a digital service that combines three independent "psychic" reading experiences into a single, unified web application.

2. The Idea & The User

Psychics is a digital service that offers users three distinct "psychic" readings — a Korean birthday-based reading, a Chinese zodiac-based reading, and a Harry Potter-style sorting hat experience — accessible through one unified selection interface. It is built for a general public audience interested in a fun, lighthearted way to learn about their "future" and themselves. Rather than introducing an entirely new concept, Psychics offers a different take on existing psychic and personality-quiz apps by bringing multiple cultural traditions together into a single, cohesive experience, rather than treating them as separate standalone tools.

3. Does this exist already?

Similar tools already exist individually. Harry Potter-style sorting quizzes are widely available, including Warner Bros.'s own apps and merchandise as well as online quizzes such as those from Buzzfeed, and Chinese and Korean fortune-telling exist both as apps and as an established in-person industry — but each as its own standalone tool. Psychics is not aiming to out-compete these with a unique market differentiator; instead, it brings all three into one unified app with three features under a shared interface, rather than three separate tools. The team is building it primarily to learn: to explore how an app comes together end-to-end — engine, narrative/content, graphics, and UI — and to do so in a lighthearted, interactive way, while owning the full process themselves.

4. Scope for this sprint

The smallest useful version for this sprint includes all three psychics working end to end, with scope deliberately limited everywhere else.

Must-haves:

- All three psychics built: Korean birthday-based, Chinese zodiac-based, and Harry Potter-style sorting hat
- Each psychic offers at least three distinct possible fortunes/outcomes (depth may vary between the three)
- A unified UI that lets users select which of the three psychics to use

Out of scope:

- User accounts, logins, or saved history
- Social sharing features
- Monetization

- Native mobile app
- Personalization beyond core inputs (birthday, zodiac, quiz answers)
- Backend/database persistence beyond in-session fortune generation

5. Success

Success for this sprint means a user can select any of the three psychics through the unified UI and receive a fortune that makes semi-sense — coherent and relevant to the inputs given. Beyond basic functionality, the team will know it worked if test users report having fun with the product: a genuine, lighthearted positive reaction rather than just technical completion.

6. Open questions or risks

Two things remain unresolved. First, the fortune-generation logic for each psychic has not yet been decided — how birthday, zodiac, and sorting-quiz inputs will map to specific outcomes. Second, the logistics of building the unified selection UI are still open: how the three psychics will plug into a shared interface without feeling like three fully separate experiences.
